

**Business Case Study for
“Build with Gemini” – Lab Event
26th Sep 6 AM – 28th Sep 6 AM IST**

Business Case study to Solve using Antigravity 2.0 during BWG Event (16-21Sep)

NovaCorp Case Study – Summary

- *NovaCorp is a large consumer electronics retailer operating through both online and physical stores. To accelerate innovation, leadership launched NovaSmart, an AI platform with a mandate to embed AI across the organization. As a result, every team developed and deployed AI agents into production.*
- *While the AI initiative was successful and rapidly adopted, the environment became difficult to manage as the number of agents grew. NovaCorp now faces challenges with limited visibility into agent operations, insufficient governance, unclear tracking of agent actions, and inadequate auditability, creating risks in oversight, compliance, and operational control.*
- *Key Takeaway:
Rapid AI adoption delivered business value, but the lack of centralized monitoring, governance, and auditing has made managing AI agents at scale increasingly complex.*

Your Role Here

- *You are the Head of AI Platform & Security, responsible for an AI ecosystem that was already established before you joined. Your primary mission is to ensure that all AI agents and tools operate in a safe, governed, transparent, and accountable manner. To achieve this, you leverage Google Antigravity and the Gemini Enterprise Agent Platform Console, which provide centralized visibility, governance, monitoring, and control over enterprise AI agents and their activities.*
- *Key Takeaway:
As the AI Platform & Security leader, your role is to bring governance, security, and accountability to an existing AI landscape using Antigravity and Agent Platform tools to manage AI agents at scale.*

Business Case study to Solve using Antigravity 2.0 during BWG Event (16-21Sep)

Your Solution :

- *To secure and govern the rapidly expanding NovaSmart AI platform, you follows six missions within a unified Gemini Enterprise Agent Platform:*
- *Discovery (M0): Identify critical risks, gaps, and priorities.*
- *Agent Registry & Identity (M1): Catalog all AI agents and assign unique identities for accountability.*
- *Agent Gateway (M2): Control and secure agent interactions, data access, and external communications.*
- *Model Armor (M3): Protect the platform by screening and filtering AI-generated content.*
- *Agent Observability (M4): Monitor agent behavior, performance, and operational activities in real time.*
- *Agent Evaluation (M5): Analyze agent decisions and outcomes to continuously improve quality, compliance, and effectiveness.*
- *Key Takeaway:*
The six missions transform NovaSmart from an ungoverned AI environment into a secure, observable, and fully auditable AI ecosystem, providing end-to-end visibility, control, and continuous improvement of enterprise AI agents

Thank You

Together, we build capability. We drive innovation. We deliver impact.
